

## Grooming Standards in TCA (Rotating Chef)

### ***Grooming standards expected in TCA***

1. Move the slider to rotate the chef 360° (simulated 3D image).
2. Wherever the slider stops, the image will have clickable hotspots.
3. Hotspots change colour when users move mouse pointer over them to help identify clickable areas (e.g. apron turns green to highlight item is clickable).
4. Users click on hotspots to get detailed info on the various items. The info may need more than one page (e.g. applied differently to different genders).
5. Use male or female model? Any difference with the number of issues posed by the different genders?
6. Detailed info displayed in the form of video/text/images in the area next to the chef.

### ***Technical Approach (for LA staff to consider)***

1. Get waiter dressed according to desired standard to stand still on a rotating platform.
2. Turn rotating platform at equal graduations (32 points).
3. Photograph waiter 32 times.
4. Moving slider switches from one photo to another.
5. Each photo has various hotspots to trigger detailed information on the subject matter.
6. Can this be done in HTML5?
